system. These files are temporary but they have a certain period of validity. If there is a block on these files the real-time file system can get blocked. What is a good way to deal with this problem. I could either write the temp file to disk when there is a temporary block or I could use regular file but still write to disk when temporary block is not present. Which is better in terms of I/O's, performance and space. A: The problem with making use of real-time file systems in a production environment is that the software will write to the file system, and will immediately seek back to the beginning of the file when a block of data is ready. This is a very demanding operation, and can have a significant impact on the performance of your entire machine. If the real-time file system is going to be part of your infrastructure, you should test to make sure that the software can be written to the file system, and still deliver on its performance requirements. If you can write the temporary file to

disk without interfering with the real-time file system, then this is a much more sensible approach. There will be some performance impact involved as the file needs to be opened, written to disk, closed, but this should be insignificant compared to the impact of the real-time file system. Deceptive messages about the safety of drugs during pregnancy. To assess whether medical information on drug safety during pregnancy can be presented in a way that is misleading. Questionnaires were distributed at a medical congress, including a question on drug safety during pregnancy. The questionnaire was structured so that a drug warning was the strongest message possible, and a corresponding question was included. Corresponding and non-

corresponding questions were presented in separate blocks. Participants were recruited from attendants of a medical congress. 300 questionnaires were distributed, of which 250 were completed. Fifty-two percent of participants regarded an explicit warning about drug safety during pregnancy as 'essential' to a health care provider. Most participants regarded an explicit warning as more important than a warning about safety in a dose-dependent fashion. On an average, they also regarded a warning that indicated safety as more important than a warning that did not indicate safety, regardless of whether it was presented in a dose-dependent or dose-independent fashion. The majority of participants regarded an explicit warning on drug safety during pregnancy as essential and they saw it as more important than other drug-related safety issues. It was therefore misleading to present the safety of a specific drug in a way that implied that the drug was safe in all scenarios.Q: Overriding the

HttpUtility.HtmlDecode method throws  
InvalidOperationException I'm using the HtmlDecode  
method that is provided with System.Web.Mvc.dll,  
but I'm not getting the expected result. My method is  
defined like this: public static string  
HtmlDecode(string input) { var decoder = new  
StringDecoder(new UTF8Encoding(true)); return  
decoder.Convert(input); } The input to HtmlDecode  
is always a StringBuilder that is being appended to  
with the string returned by the HtmlDecode method.  
But the code below results in a  
InvalidOperationException
