A native 2D CAD application, AutoCAD is designed to handle complex drawings, rendering, and editing tasks. Its emphasis on 2D work is what makes it popular with architects, engineers, and draftsmen. AutoCAD excels in the creation of floor plans, architectural designs, mechanical schematics, and electrical designs. In this tutorial, I'll be showing you how to create floor plans with AutoCAD. Note: This tutorial is written for people who are new to AutoCAD and the English language. The language might be a little bit simplified, so be gentle. I'll try to explain things as clearly as possible, but I can't guarantee that everything will be crystal clear. AutoCAD Tutorial: How To Make Floor Plans STEP 1 Begin with a new drawing by selecting File ➤ New. This brings up a pop-up dialog window where you can choose the desired layout of the floor plan. For this tutorial, we're going to use a regular 2D layout. In the left-hand side, you can choose the width and height of the floor plan. Select Orthographic Projection from the View Tab. or Select the view type by pressing the SHIFT key. or Use the Drawing Properties palette Afterwards, you can see that the View palette is already selected to Orthographic Projection. You can also check the Orthographic Drawing option in the Windows Control Panel to show the drawing in its orthogonal mode. If you don't want to add background colors and patterns to the floor plan, uncheck the Color Selection box. Next, we need to set the units of measurement and define the scale. The default units of measurement for the application is in millimeters. We'll need to define a scale. To set the scale, open the Scale dialog by selecting Edit ➤ Preferences and click on the Drawing/Document Tab. Uncheck the Use Real-World Size checkbox and enter the desired scale in meters. Uncheck the Use Real-World Size checkbox, enter the desired scale in meters. and click OK. NOTE: If you don't want to use the full-size of the floor plan, you can always choose the smaller drawing to be the floor plan. Enter the desired scale in meters, such as 10, 25, 50, 100, 150,

File-based methods In addition to these programming methods, AutoCAD also has an ability to read and write files directly, either by command-line tools or by an API call to an external application. For example, the AutoLISP method of reading from a file named APISAMPLE.DAT' can be replaced by an external program. The package it self has a java file called AppList.java and a layout named as app_list.xml I am using the following code to import the class: import com.example.android.myapplication.AppList; But it gives an error saying that app_list can't be resolved to a variable. Here is the screenshot of the error: A: Your code is fine, here's what you can do to solve the problem: Open the build.gradle (project structure) file (Android Studio, open menu File > Project Structure) Open Module's root, where there is a dependency to AppList. Right click on this line and select Open Module Settings. In the settings, find the AppList's gradle dependency, and there you can change the configuration to "compile" or "provided" (no error will happen, the project is already compiled, only the JAR file is not yet copied in the project/libs folder).
