The Web Services edition of AutoCAD is typically bundled with related products, such as AutoCAD WS Dashboard, which is the Web-based, point-and-click user interface (UI) to view and manage the drawings and data stored in AutoCAD WS. AutoCAD WS provides a simple, intuitive remote access to AutoCAD drawings for sharing with both other AutoCAD users and users from other applications. History [edit] AutoCAD was first released on December 18, 1982 for the CP/M operating system and on January 14, 1983 for the Apple II computer.[4] Both versions were priced at \$495. I am working with streams and filter function which return a stream. For example, List list = new ArrayList(); list.add("john"); list.add("mary"); list.add("joe"); list.add("steve"); My expected result is john, steve I can achieve my result using something like the below: Stream.of(list).filter(e -> ! e.equals("john")).collect(Collectors.toList()); If we assume that my list is a list of String instead of a list of String, the behavior is different from the result. My question is, why does java.util.List behave like this? Do we treat the empty sequence as the first element for filtering purpose? If yes, it's a good practice? A: When you do list.add("john"); the new element is added to the end of the list. When you do list.add("john"); list.add("steve"); it's equivalent to this list.add("john"); list.add("steve"); list.add("john"); list.add("steve"); So, "john" will be the first element of the list, and it is not equal to "steve", and thus it will be discarded.
